Acknowledgements

The MDPH would like to thank school nurses and administrative staff in public, private and charter school systems who contributed to the success of the seventh year of its pediatric asthma surveillance effort by completing a pediatric asthma surveillance form. We would also like to thank the asthma surveillance advisory committee for its valuable input during both the planning and implementation phases of the project.

Pediatric Asthma in Massachusetts 2008-2009

I. Introduction

Asthma is a common chronic disease among children that appears to have increased in prevalence over the past decades [1]. It continues to affect more than 9.1% of Americans under the age of 18 [2], and is the fourth-ranking cause of hospitalization among children under the age of 15 [3]. The estimated cost of treating asthma in those under the age of 18 is \$3.2 billion per year [4] and over \$11.5 billion for the entire US population [5]. Due to the high prevalence, and the cost attributed to this disease, public health organizations across the country have made asthma surveillance a priority.

Historically statewide asthma prevalence had been collected through the Behavioral Risk Factor Surveillance System (BRFSS), a random telephone survey implemented by state health departments in conjunction with the U.S. Centers for Disease Control and Prevention (CDC). Although BRFSS data are useful for estimating asthma prevalence in the state as a whole, they do not provide information regarding asthma at the community level. Data on hospitalizations for pediatric asthma are available at the community level on MassCHIP and reported in the Department's Burden of Asthma in Massachusetts report. However, the numbers from each of these sources likely represent an underestimate of pediatric asthma prevalence since they reflect only asthma treated in the emergency department or hospital.

Because of the limitations of the above mentioned data sources, there remains a need to better quantify the scope of the problem on the local level, particularly as it relates to the pediatric population. Between 2001 and 2004, the self-reported prevalence of asthma in the US was substantially higher in the 5-14 year old age group than in any other age group [6]. Similarly, prevalence in those aged 0-17 increased from 3.6% in 1980 to 7.5% in 1995. While these rates have leveled off in recent years, they are still higher than in previous years [7].

In an effort to better understand asthma in pediatric populations, the Massachusetts Department of Public Health, Bureau of Environmental Health (MDPH/BEH) implemented a surveillance system to capture asthma prevalence in the 5-14 year old age group beginning in the 2002-2003 school year. This surveillance system has helped to document the prevalence of pediatric asthma in Massachusetts. This report describes the methods used to implement pediatric asthma surveillance and summarizes the asthma prevalence data collected during the 2008-2009 school year, which

encompasses all public and private schools in the Commonwealth serving grades Kindergarten through 8. It also provides tables and figures with data covering the period 2003-2009. (Reports from years one through six can be found on the MDPH website at www.mass.gov/dph/asthma). The methods followed were based upon the experience gained from the previous surveillance efforts and through discussions with the School Nurse Advisory Committee comprised of school nurse leaders from around the state, the MDPH/Essential School Health Service (ESHS) staff, and MDPH/BEH staff. (Appendix I)

In addition to the efforts of this surveillance project, MDPH/BEH has developed a number of health and environmental databases through its Environmental Public Health Tracking (EPHT) program, an ongoing data collection and analysis system, funded by the CDC. The MA EPHT system allows public health officials, the general public, and others to look at data about environmental hazards and health indicators to determine the need for public health actions that might be warranted. Data collected as part of EPHT are now available to the public on the Massachusetts EPHT portal (<http://matracking.ehs.state.ma.us/>). The pediatric asthma data available includes prevalence estimates by school and gender and also by city/town of residence. This data is available in tabular format as well as graphically and for some data, maps may be generated to visually examine prevalence.

II. Methods

A. Regulatory Authority/Data Confidentiality

Massachusetts law authorizes the MDPH/BEH to access school health records in public health investigations and requires the strict protection of the privacy of the information collected (Massachusetts Student Record Registration Section 23.7 (4) (h) and MGL c111, s 24A). The MDPH also has regulatory authority to access health records for asthma and other selected health outcomes through 105 CMR 300.192—public health regulations for the reporting of environmentally-related diseases to the MDPH. This authority is consistent with the requirements to protect privacy as provided through the federal Health Insurance Portability and Accountability Act (HIPAA).

MDPH/BEH in collaboration with school health nurses collect data on children diagnosed with asthma within each school on an aggregate level. No information that might identify individual students is currently collected. The MDPH/BEH received approval for this project as part of a larger

effort aimed at tracking several health outcomes thought to be impacted by environmental exposures.

B. Target Population

During the 2008-2009 school year the MDPH/BEH requested all public, private, and charter schools in Massachusetts serving grades Kindergarten through 8 to report the number of students with asthma enrolled in the school. This resulted in data from 2,056 schools, excluding school closures and schools that did not serve any eligible grades, and for approximately 708,000 students.

C. Project Definition of Asthma

As with the six previous years of pediatric asthma surveillance, a specific clinical definition of asthma was not provided to nurses or administrative staff. Instead, schools were asked to report the number of students known to them as having a diagnosis of asthma. This broad based definition captures asthma of all types, including allergic asthma and exercise-induced asthma. Likewise, it helps to capture a range of disease severities from mild to severe. This ensures a more sensitive prevalence estimate by making sure that all cases of asthma are reported, not simply those severe enough to warrant hospital treatment. Specific sources in the health record of a child's asthma status included emergency cards, physical exam forms, parent resource centers, parent communications, student communications, health care provider documentation, or direct observation of an asthma attack.

In 2001, MDPH/BEH conducted a verification effort during the Merrimack Valley Pediatric Asthma study which consistently supported the high quality and significant reliability of school health asthma data (MDPH, BEH, *Air Pollution and Pediatric Asthma in the Merrimack Valley, 2008* (www.mass.gov/dph/asthma)).

D. Data Collection

Beginning in January 2009, school health contacts were mailed a one-page reporting form asking for aggregate numbers of children with asthma by grade, gender, community of child's residence, race/ethnicity, and school building. Aggregate numbers of children with diabetes were also collected as part of this surveillance. Students were reported by type of diabetes (Type 1, Type 2, or Type Unknown), grade, gender, community of residence, race/ethnicity, and school building. The list of schools was generated by the Massachusetts Department of Elementary and Secondary Education (DESE) and included all schools that served any of grades Kindergarten through 8. Because several

of these schools serve grades that are not included in this surveillance effort (i.e. schools serving grades 9-12), the report form and instruction sheet made it explicitly clear that only data on students in grades K-8 should be reported (Appendix II).

The school's name, address, and DESE school code were pre-printed on each form to facilitate completion of the form. In addition, an instruction sheet for completing the form was provided. The reporting forms were sent via the U.S. Postal Service. Once the forms were completed by the school health contact, they were faxed or in some cases mailed back to the MDPH. Follow-up telephone calls were placed to nurses who did not respond by April 2009. School enrollment data were collected from the DESE. DESE was able to provide enrollment figures for all public schools and most private schools. In some instances where private school enrollment could not be obtained from the DESE, school websites and other sources were consulted. Schools that did not return a complete surveillance form or for which 2008-2009 enrollment data could not be obtained by July 2009 were considered non-responsive and not included in the prevalence estimates presented.

E. Data Management

Massachusetts DESE school identifier codes were assigned to each school's surveillance form. MDPH/BEH staff reviewed the surveillance forms for completeness and accuracy, and attempted to resolve missing data or inconsistencies. Once cleaned, the data were entered into a text file and then imported into a Microsoft Access database.

F. Data Analysis

Data analysis was performed with Microsoft Excel 2003 and Microsoft Access 2003. The participation rate amongst all eligible schools was calculated. The prevalence of asthma with 95% confidence intervals was calculated for each participating school, for each community (city/town) of residence, and for the state as a whole. Statewide prevalence estimates were also calculated by gender, grade level, and by race/ethnicity. Statewide prevalence estimates were compared to previous years of this surveillance and to prevalence estimates generated by other sources.

To help interpret the asthma prevalence estimates, 95% confidence intervals (95% CI) were calculated to determine the precision of the estimate [8]. In all cases where the number of asthmatics was less than 20, the Poisson distribution was used to calculate confidence intervals. In all other circumstances, the standard normal distribution was used. Specifically, a 95% CI is the range of

estimated prevalence values that have 95% probability of including the true prevalence for the population. Therefore, a CI that is narrow allows for a fair level of certainty that the calculated estimate is close to the true estimate for the population. A wide interval leaves considerable doubt about the true estimate, which could be much lower or higher than the calculated prevalence estimate. Confidence intervals for individual schools and communities of residence were also compared with intervals for the state prevalence estimate. Intervals that did not overlap suggested that the prevalence estimate for the school was statistically significantly different than the state estimate.

As mentioned previously, asthma prevalence was calculated by community (city/town) of residence as well as by school. Community (city/town) of the child's residence was recorded by the school nurse/health contact for each child with asthma. All students with asthma from each community (city/town) of residence were totaled and this figure was used as the numerator. Similarly DESE provided a 2008-2009 total enrollment file by community (city/town) of residence for all enrolled students in the state. These data were used as the denominator for calculating each community's (city/town) prevalence.

III. Results

A. Participation

MDPH/BEH received asthma data from a total of 2,093 public, private, and charter schools. This accounts for 100% of the eligible schools serving any of grades K-8 that MDPH/BEH mailed surveys to, but does not include 18 special education schools that were not included in the original mailing. Of the 2,093 returned surveys, MDPH/BEH found 37 schools that were not eligible due to closure in the school year of interest or not having served any of grades K-8. This left 2,056 eligible schools for analysis. Participation rates have increased through each continued year of surveillance, as seen in Figure 1. Given the high participation rate across all municipalities, the community-specific prevalence estimates shown can be considered representative of the occurrence of pediatric asthma in each of the 351 Massachusetts communities (cities/towns).

B. Reported Asthma Prevalence

1. School Prevalence

The reported prevalence of asthma among the 708,320 students enrolled in the participating schools was 10.9% (95% CI 10.8% - 11.0%). Prevalence ranged from 0% to 75.0%¹ amongst the individual

schools. Prevalence figures for the 2,056 participating schools are listed in Appendix III, and their frequency distribution is presented in Figure 2.

2. Community Prevalence

Reported asthma prevalence among Massachusetts communities (city/town) can be found in Appendix IV, and their frequency distribution is presented in Figure 3. Community (city/town) prevalence ranged from a low of 0% to a high of 24.3%. There were 50 communities whose prevalence was statistically significantly higher than the state as a whole; 128 communities with prevalence statistically significantly lower than the state, and the prevalence in the remaining participating communities (n=173) was not statistically significantly different from the state.

3. Other Variables

Reported prevalence for all children by grade level showed an increase in asthma from Kindergarten through grade 5 (Kindergarten 9.1% to 5th grade 11.6%). Between grade 6 and grade 8 there was a decrease in asthma prevalence (6th grade 11.4% to 8th grade 10.6%). The prevalence increases between Kindergarten and grade 1 and also between grade 1 and grade 2 were statistically significant, as was the decrease in prevalence between grade 7 and grade 8 (Table 1). Asthma prevalence for males was 12.6% and for females was 9.2% (Table 2; Figure 4).

4. Race

Of the 2,056 eligible schools, MDPH/BEH was unable to obtain either race-specific asthma data or race-specific enrollment data for 119 schools. Table 3 shows the prevalence of asthma among children in Kindergarten through grade 8 by race/ethnicity for the schools able to provide information. Statewide pediatric asthma prevalence was highest for Black and Hispanic students at 14.0% for both racial classes. American Indian students had a prevalence of 10.3%. The prevalence among White students was 9.8%. Asian students had the lowest rate of pediatric asthma prevalence in Massachusetts at 7.9%.

5. Diabetes

Results from the diabetes analysis are presented separately. For these results, please go to www.mass.gov/dph/environmental_health. Diabetes data can be found by clicking the “Environmental Health Investigations” link.

¹Excludes schools with total enrollments less than 10

IV. Discussion

A. School Specific Prevalence

While there was notable variation in reported asthma prevalence between schools (range of 0 – 75.0%), caution should be used when comparing school prevalence estimates. It is possible that some schools with either very high or very low prevalence may be impacted by methodological differences in reporting. As mentioned previously, however, validity of the data in school health records is not likely to be a factor in this observed variation due to MPDH/BEH verification efforts conducted prior to implementing the statewide pediatric asthma surveillance system.

School prevalence figures do not necessarily indicate the prevalence of asthma within the community that the school is located. This is because the reported number of students with asthma often includes students who live in, and/or commute from different communities (cities/towns).

It is also important to note that a higher prevalence of asthma at a school does not necessarily indicate environmental problems within that school. Pediatric respiratory symptoms have been associated with a number of factors including exposures from the outdoor environment [9-11], exposures in the home environment [12-14], genetic factors/race [15-16, 23], and lifestyle factors [17-18].

Estimates of pediatric asthma prevalence by race and ethnicity are consistent with what has been reported in the scientific literature for other geographic areas with prevalence highest among Black and Hispanic children and lowest among Asian children [19]. However, in this report prevalence by race and ethnicity was only estimated for the state as a whole and therefore has some limitations, including the fact that specific race and ethnicity information was unavailable for 119 schools. This includes schools who reported their asthmatics as belonging to “other” racial categories or “unknown” racial categories. This also includes schools for which DESE was unable to provide race-specific enrollments. Further, there were a number of schools where the reported number of children with asthma by race and ethnicity was not consistent with the number of children reportedly enrolled (DESE 2008-2009 enrollment dataset) in the same racial and ethnic categories (e.g., the number of Hispanic children with asthma exceeded the number of Hispanic children enrolled). This observation suggests that the prevalence figures are crude estimates.

This is the second year that MDPH has reported asthma data by race/ethnicity. As with the initial

year, data limitations did not allow for municipal level estimates of prevalence. Nevertheless, presenting the statewide estimates provides useful information. Future years of data collection will focus on improving these estimates by obtaining more precise race and ethnicity information from school administrators and to provide prevalence estimates by race and ethnicity at the community level.

B. Community Level Prevalence

In addition to school prevalence, this report presents asthma prevalence by community of residence (city/town). Community prevalence estimates were determined with the aid of residence-specific enrollment data provided by the Massachusetts DESE. Hence the community prevalence figures reflect the occurrence of asthma in individual cities and towns among children enrolled in grades K-8 who live in those communities (city/town), regardless of the location of the school attended.

C. Comparison with Previous Years of Data

The statewide school-based prevalence of pediatric asthma for the 2008-2009 school year was higher than previous years at 10.9% (Table 2). Results from this surveillance effort show a general trend of increased prevalence throughout the years of this surveillance. The 2008-2009 statewide prevalence was statistically significantly higher than the first four years of surveillance, however was not statistically significantly higher in comparison to the 2006-2007 or 2007-2008 school years. The fact that there has been no statistical increase in prevalence the past three years may indicate that prevalence is stable for the school-age population. Since 2002 the school participation rate in the surveillance effort has risen from 70% to 100% (Figure 1). With any surveillance program, response rates generally improve in each successive year resulting in more precise estimates of statewide and community specific estimates.

D. Comparison with Other Surveillance Programs

The main sources of comparison for pediatric asthma prevalence data are the BRFSS, National Survey of Children's Health, and the National Health Interview Survey (NHIS). These surveys break asthma prevalence into "current" or "lifetime" asthma. Lifetime asthma refers to people who have ever been told that they had asthma, while current asthma reflects those individuals who have active disease. Because school health contacts in this surveillance system are not provided with a specific definition of asthma, it is likely that the prevalence reported here is a hybrid of current and lifetime

asthma. The data generated in this surveillance are similar to asthma prevalence estimates from other sources. The 2008 BRFSS reported 9.8% of Massachusetts children 0-17 years of age “currently has asthma.” [20]. The 2007 National Survey of Children’s Health reports that 9% of US children, and 10.8% of Massachusetts children, currently have asthma [21]. In terms of lifetime asthma prevalence, the 2007 CDC National Health Interview Survey reported 14% of US children 5-14 years had ever been diagnosed with asthma [2].

Caution should be used when making comparisons between different surveillance systems. BRFSS and NHIS asthma prevalence figures give an estimate of the range in which to expect Massachusetts prevalence values to fall within, but different methodologies and target populations make them less than ideal for comparison with MDPH/BEH surveillance figures. The BRFSS and NHIS figures are derived from samples of households and self-reported health information that may affect the precision of the prevalence estimates. In Connecticut, a school-based surveillance effort similar to that used in Massachusetts and, therefore, producing more comparable figures is presented in a recent report describing nurse-reported asthma in public school students. The report describes 9.7% asthma prevalence among Connecticut students in grades K-5 [22]. Reported asthma prevalence in Massachusetts K-5 students described in this report was 10.8%. Prevalence data for grade 6-8 students in Connecticut are not available for comparison.

E. The Value of Asthma Surveillance

The value of the Massachusetts approach to pediatric asthma surveillance is several fold. As part of a separate investigation of pediatric asthma in the Merrimack Valley, the MDPH/BEH found school nurses and student health records to be a reliable source of health information. Further, tracking the prevalence of asthma through the schools will make it possible to assess the magnitude of the problem of pediatric asthma at the local level and, notably, to better determine the potential role of indoor and outdoor environmental exposures in the etiology of the disease. As stated previously, community-level asthma prevalence data will be useful in planning and implementing environmental health investigations and public health interventions based on factors specific to the community in question. With proper diagnosis and appropriate asthma management, including reducing exposure to environmental triggers in homes and schools, asthma can be controlled.

V. Future Efforts for Pediatric Asthma Surveillance

This report summarizes the results of the 2008-2009 asthma surveillance effort. During the project’s

first year, asthma surveillance was carried out in a subset of Massachusetts schools. In all subsequent years, surveillance included all public, private, and charter schools serving any of grades K-8 in each of the Commonwealth's 372 school districts. The 2008-2009 asthma surveillance collected data by gender, grade, school, race/ethnicity and community of residence. Surveillance in future years will continue to collect these variables and will also attempt to collect enrollment data on the community level by race and ethnicity for private schools. This will allow for more thorough analyses and comparison of prevalence between different racial/ethnic classifications. The Massachusetts EPHT website (<http://matracking.ehs.state.ma.us/>) will also continue to be updated and further developed to include mapping of asthma prevalence across the state and the grouping of years to assess trends and patterns of asthma prevalence. The website is also planned to be expanded in the future to permit prevalence to be evaluated in relation to factors such as ambient air pollution.

Figure 4. MA Pediatric Asthma Prevalence, 2003-2009

*Only 44% of schools asked to participate; gender-specific estimates not generated for this year

Table 1. Reported Prevalence By Grade 2008-2009		
Grade	Prevalence (%)	95% CI
Kindergarten	9.1	8.9 – 9.3
1	10.1	9.9 – 10.3
2	10.9	10.7 – 11.2
3	11.3	11.1 – 11.5
4	11.4	11.2 – 11.7
5	11.9	11.6 – 12.1
6	11.6	11.4 – 11.8
7	11.3	11.1 – 11.5
8	10.8	10.6 – 11.0

Table 2. MA Pediatric Asthma Prevalence by Gender 2003-2009

	Prevalence		
	Male	Female	Statewide
2002-03*	--	--	9.2 (9.1-9.3)
2003-04	10.9	8.0	9.5 (9.4-9.6)
2004-05	11.7 (11.6-11.8)	8.6 (8.5-8.7)	10.0 (9.9-10.1)
2005-06	12.3 (12.2-12.4)	8.8 (8.7-8.9)	10.6 (10.5-10.7)
2006-07	12.5 (12.4-12.6)	9.0 (8.9-9.1)	10.8 (10.7-10.8)
2007-08	12.5 (12.4-12.6)	9.1 (9.0-9.2)	10.9 (10.8-10.9)
2008-09	12.6 (12.5-12.7)	9.2 (9.1-9.3)	10.9 (10.8-11.0)

*Surveillance not statewide; only 44% of schools asked to participate; gender-specific estimates not calculated

Table 3. MA Pediatric Asthma Prevalence by Race/Ethnicity 2008-2009*			
Race/Ethnicity	Number of Children with Asthma	Number of Children Enrolled	Prevalence of Asthma (%)*
Hispanic	13,673	97,763	14.0
White	48,191	490,315	9.8
Black	7,783	55,500	14.0
Asian	2,930	37,012	7.9
American Indian	186	1,807	10.3
Total	72,763	682,397	10.7

* Prevalence estimates do not include 119 schools with missing or incomplete race/ethnicity information.

2008-2009 Pediatric Asthma Surveillance Form and Instructions

Instructions for Completing the 2008-2009 Pediatric Asthma/Diabetes Surveillance Form

Massachusetts Department of Public Health Bureau of Environmental Health

Who should complete this form?

This form is designed to be completed by the school nurse or school health contact for the school listed on the top of the surveillance form.

When should this form be returned?

The form should be completed and returned via fax to 617-624-5560 as soon as possible, preferably no later than 2 weeks from the day it is received by the school nurse or school health contact.

Which students should I include on this form?

Please include students with asthma and diabetes in grades kindergarten through 8 only. Do not include pre-kindergarten or high school students on this form. Students are to be reported by the city/town in which they reside. If your school does not serve any of grades K-8, please state so on the form and send it back by fax to 617-624-5560.

How should I report numbers by grade in the case of ungraded students?

Students younger than 5 or older than 14 should not be reported on this surveillance form. For students with asthma or diabetes who are not assigned to a particular grade, use the following guideline:

5 years old = kindergarten	8 years old = Grade 3	11 years old = Grade 6
6 years old = Grade 1	9 years old = Grade 4	12 years old = Grade 7
7 years old = Grade 2	10 years old = Grade 5	13 & 14 years old = Grade 8

How do I report the number of asthmatics and diabetics by city/town of residence?

Some students may commute from towns other than that in which the school is located, therefore please report the number of asthmatics and diabetics by the city/town they live in. If your school serves students from multiple cities/towns, please photocopy the surveillance form and fax back all copies to the Department of Public Health.

How do I report the race/ethnicity data?

For asthma and for diabetes, please fill in the tables for race/ethnicity by marking the number of males and females in each category. If your school has students that fall into more than one racial category, for example students that are Black *and* Asian Non-Hispanic, please use the "multi-racial, non-hispanic" category. For students who do not fall into any of the listed categories, please record them in the "other" category. If you do not know the race/ethnicity of certain students, please record them in the "unknown" category.

What if the school name, address, or district information printed on the form is not correct?

If the information printed on the form for your school is not correct, please check the box provided on the surveillance form. Then cross out the incorrect information and write in the correct information in any blank space that is available. The information will be updated in our database upon receipt of the form.

Who should I contact with questions or comments regarding this form or the pediatric asthma/diabetes surveillance project?

Questions may be directed via email to the project mailbox at Ped.Asthma@dph.state.ma.us or via telephone to 617-624-5757. Please ask for the Asthma Coordinator.

Massachusetts Department of Public Health, Bureau for Environmental Health
 Pediatric Asthma/Diabetes Surveillance Form, 2008-2009
 Please provide information for the SCHOOL LISTED BELOW. Please keep a copy for your records.

School Name: _____ State: _____ Zip code: _____ School Code: _____
 Street Address: _____
 City: _____
 Check here if any of the school information is INCORRECT. Write in the correct information in the corresponding spaces above.
 Name of person completing form: _____ Title: RN LPN Administrator Administrative Assistant Other (specify) _____
 Telephone: (____) _____-____ Check all grades that this school has: K 1st 2nd 3rd 4th 5th 6th 7th 8th

ASTHMA

For each CITY/TOWN that your school serves, please provide the TOTAL NUMBER OF K-8 STUDENTS with ASTHMA by GENDER, GRADE, AND RACE/ETHNICITY. Put a zero in the appropriate boxes if there are no male or female children with asthma in that grade. Leave the boxes empty if your school does not have that grade.

CITY/TOWN OF RESIDENCE: _____

	K	1	2	3	4	5	6	7	8
M									
F									

	Male	Female
White, Non-Hispanic		
White, Hispanic		
Black, Non-Hispanic		
Black, Hispanic		
Asian, Non-Hispanic		
American Indian/Alaska Native, Non-Hispanic		
Pacific Islander/Hawaiian, Non-Hispanic		
Multi-Racial, Hispanic		
Multi-Racial, Non-Hispanic		
Other		
Unknown		

DIABETES

For each CITY/TOWN that your school serves, please provide the TOTAL NUMBER of K-8 students with DIABETES by TYPE, GENDER, GRADE, AND RACE/ETHNICITY. Put zeros if there are no males and females with diabetes in that grade. Leave boxes empty if your school does not have that grade.

CITY/TOWN OF RESIDENCE: _____

	K	1	2	3	4	5	6	7	8
Male Type 1									
Female Type 1									
Male Type 2									
Female Type 2									
Male Type Unknown									
Female Type Unknown									

	Type 1		Type 2		Type Unknown	
	Male	Female	Male	Female	Male	Female
White, Non-Hispanic						
White, Hispanic						
Black, Non-Hispanic						
Black, Hispanic						
Asian, Non-Hispanic						
American Indian/Alaska Native, Non-Hispanic						
Pacific Islander/Hawaiian, Non-Hispanic						
Multi-Racial, Hispanic						
Multi-Racial, Non-Hispanic						
Other						
Unknown						

If your school serves students from multiple cities/towns, please photocopy this form and indicate the total number of pages you will be submitting here: _____
 Please return this completed surveillance form by fax within 2 weeks to: 617-624-5560. For questions, please call 617-624-5757 and ask for the Asthma Coordinator. Thanks!
